ReaSoft Firewall

KEEP CONFIDENCE IN YOUR BUSINESS FUTURE UNDER THE PROTECTION OF REASOFT NETWORK FIREWALL

ReaSoft Development announces the immediate release of their new product, ReaSoft Network Firewall, a leading solution for corporate internet access management and total network defence against any external unwarranted interference.

ReaSoft Network Firewall was specifically designed for small and medium-size businesses. It provides excellent reliability and performance with minimal resource requirements, supports multi-networks and possesses simple management tools. Today all computers, regardless of operating systems, can be vulnerable to hackers intent on planting "trojan horse" programs that let them steal your information or involve your computers in nefarious activity if unprotected. To make business more secure, resort to installing ReaSoft Network Firewall, which seems to be one of the total network defense against any external unwarranted interference.

ReaSoft Network Firewall is a new generation corporate gateway firewall which protect the network from external and internal attacks, provides Internet access to users and offers enhanced traffic control features. The program is designed for small and medium-sized enterprises to improve the corporate security and meet the network management needs. Configure the rules for a user or a group of users determining access to network resources, such as mail, FTP, web servers, etc. With the help of the set rules the user can control what services to let through your firewall, and which ones to keep out as well as what action to take for each connection. It is possible to configure access policies for each network regardless of its type and parameters of the security policies applied for the other networks. The important feature of ReaSoft Network Firewall is that it allows to configure access to local resources from external networks. All these rules are about preventing stealing business information or hackers attacks that may turn the computer into a "zombie" and add it to a botnet to send spam, act as a server, or steal personal information.

Besides firewall policy rules, ReaSoft Network Firewall enables to configure traffic usage policy for any network objects or groups. Specificate traffic usage by limiting quotas for any convenient period.

Moreover, ReaSoft Network Firewall permits to monitor the network activity. It controls the established sessions and connections, traffic usage by users and services. System and

security events are available to gather information about Firewall activity and system health. ReaSoft Network Firewall allows you to monitor the activity of your network in real time.

To allow you to completely control the work of ReaSoft Network Firewall it has its own event system that logs system events and security events. It is recommended to look through ReaSoft Network Firewall events regularly to fix errors and prevent failures.

Most people aren't paranoid enough about their security while they are connected to the Internet. The chances of suffering from some type of Internet hack are rising, especially when you don't have firewall installed. Most people are surprised when they discover that their newly installed personal firewall reports that their computers are getting scanned or probed from the Internet several times a day. But does it worth risking? Think twice before risking and getting hacked. This is especially true if you keep personal and essential business information on your system. Provided that you don't want to get sunk use ReaSoft Network Firewall. With all its advantages and low cost you will win more than you are expecting.

Compatibility

ReaSoft Network Firewall is completely compatible with all components in the Windows 2000/XP/2003 operating systems and also with server products from Microsoft, such as Exchange Server, MS SQL Server, Share Point Portal Server and others.

When ReaSoft Network Firewall is running together with Microsoft products, it does not impose any limitations on their normal operation.

There may be conflicts with some firewalls and traffic control software. To prevent failures in your system, ReaSoft Network Firewall can detect such products.

System Requirements:

Windows® 2000 / XP / 2003 server
(full 32-bit & 64-bit editions support)
